

ABSTRACT

5 An automatic teller machine for the automatic
withdrawal and deposit of money in accordance with an
operation of a customer, wherein a security camera able
to capture an image when the shutter is opened is
provided at a predetermined location in a bill receptacle
opened and closed by a shutter together with a sensor for
detecting the insertion of a hand into the bill
10 receptacle and wherein when insertion of a hand into the
bill receptacle by a customer when taking out bills is
detected, an image including the hand of the customer is
captured by the security camera. As a result, it is
possible to capture the image of the customer for use in
15 security purposes without allowing the customer to become
aware of the existence of the camera.
